

Product Overview

PAETEC's Hosted Web Security

What is Hosted Web Security?

Securing a network is a multi-faceted task whose threat vectors are constantly changing. One of the easiest and most effective ways to shield your business from security breaches is to implement a conservative Web acceptable use policy, limiting the exposure that your users have to Web-based threats. Web filtering is a key aspect in building an effective defense strategy.

PAETEC's Hosted Web Security service is a cost-effective and efficient way to implement a Web filtering policy, while taking advantage of added layers of threat mitigation to maximize your organization's Web browsing security. With this cloud-based service, there is no hardware to buy and you'll automatically block spyware, phishing scams, viruses, and malware before it reaches your network.

Businesses are increasingly at risk due to the difficulty of successfully implementing roaming user browsing policies. Most Web security solutions provide few answers to this shortfall; however, PAETEC's Hosted Web Security service allows administrators to configure remote user policies and access rules that can be tracked, filtered, and implemented with the same ease and effectiveness as a user on the company network.

Customer administrators have the capability to block and allow access based upon site content, URL category, specific URL or IP address, and/or site reputation. Each of these access controls can be customized to individual users, user groups, or organization-wide, and the detailed, customizable reporting and forensic capability of the customer portal allows administrators to monitor activity in detail.

Solution Features & Benefits:

- User, group, and/or company-wide URL filtering
- Advanced filtering support for Web 2.0
- Content, category, and URL-specific block/allow capabilities
- Spyware blocking
- Triple virus and worm scanning
- Mobile user policy support
- Fraud and phishing protection
- Malware protection
- Automatic, continuous updates
- Granular reporting and forensic capability

Key Facts:

- Low-cost, easy-to-manage Web protection
- Simplified 24 × 7 management
- Works at the network perimeter to protect the company, employees, and network assets from spyware, viruses, and phishing attacks
- Conserves network bandwidth
- Enhances employee productivity by eliminating unauthorized Internet usage
- Reduces liabilities associated with compliance breaches
- Provides around-the-clock protection and real-time updates
- Infinitely scalable solution with no hardware to purchase
